Allowing cookies to be set

Most times DLS advise clients to ‘clear their cache and cookies’, however, in some instances this may not resolve the issue they are having.

When using Safari to test access to a site, after authenticating, the following message appeared:

*Licensing agreements for these databases require that access be extended only to authorized users. Once you have been validated by this system, a "cookie" is sent to your browser as an ongoing indication of your authorization to access these databases. This cookie only needs to be set once during login.*

*If you are using a firewall or network privacy program, you may need reconfigure it to allow cookies to be set from this server.*

*As you access databases, they may also use cookies. Your ability to use those databases may depend on whether or not you allow those cookies to be set.*

To overcome this problem, select the little cog in the top right hand corner of the browser

Click on preferences

Then select ‘Privacy’

As you can see above, the setting is for the cookies to be blocked ‘Always’
Allowing cookies to be set

Change this setting to ‘Never’

Close the screen, and then close the Safari browser.

Re-open Safari

Select resource to test authentication
